Introduction to Web Design & Development

Lesson One

Nicole Bieber

Introduction to me

Software Developer at **Amplify**

Makes educational apps

Studied computer science at MIT

Favorite TV Show: Dr Who

Everything is deeply intertwined. In an important sense there are no “subjects” at all; there is only all knowledge, since the cross-connections among the myriad topics of this world simply cannot be divided up neatly.”
—Ted Nelson, Computer Lib/Dream Machine

When human beings acquired language, we learned not just how to listen but how to speak. When we gained literacy, we learned not just how to read but how to write. And as we move into an increasingly digital reality, we must learn not just how to use programs but how to make them.”
-Douglas Rushkoff, Program or Be Programmed

The single most significant change in the politics of cyberspace is the coming of age of this simple idea: The code is law. The architectures of cyberspace are as important as the law in defining and defeating the liberties of the Net.”
-Lawrence Lessig, The Code Is the Law

Course Overview

Tuesdays & Thursdays – 6:30-9:30

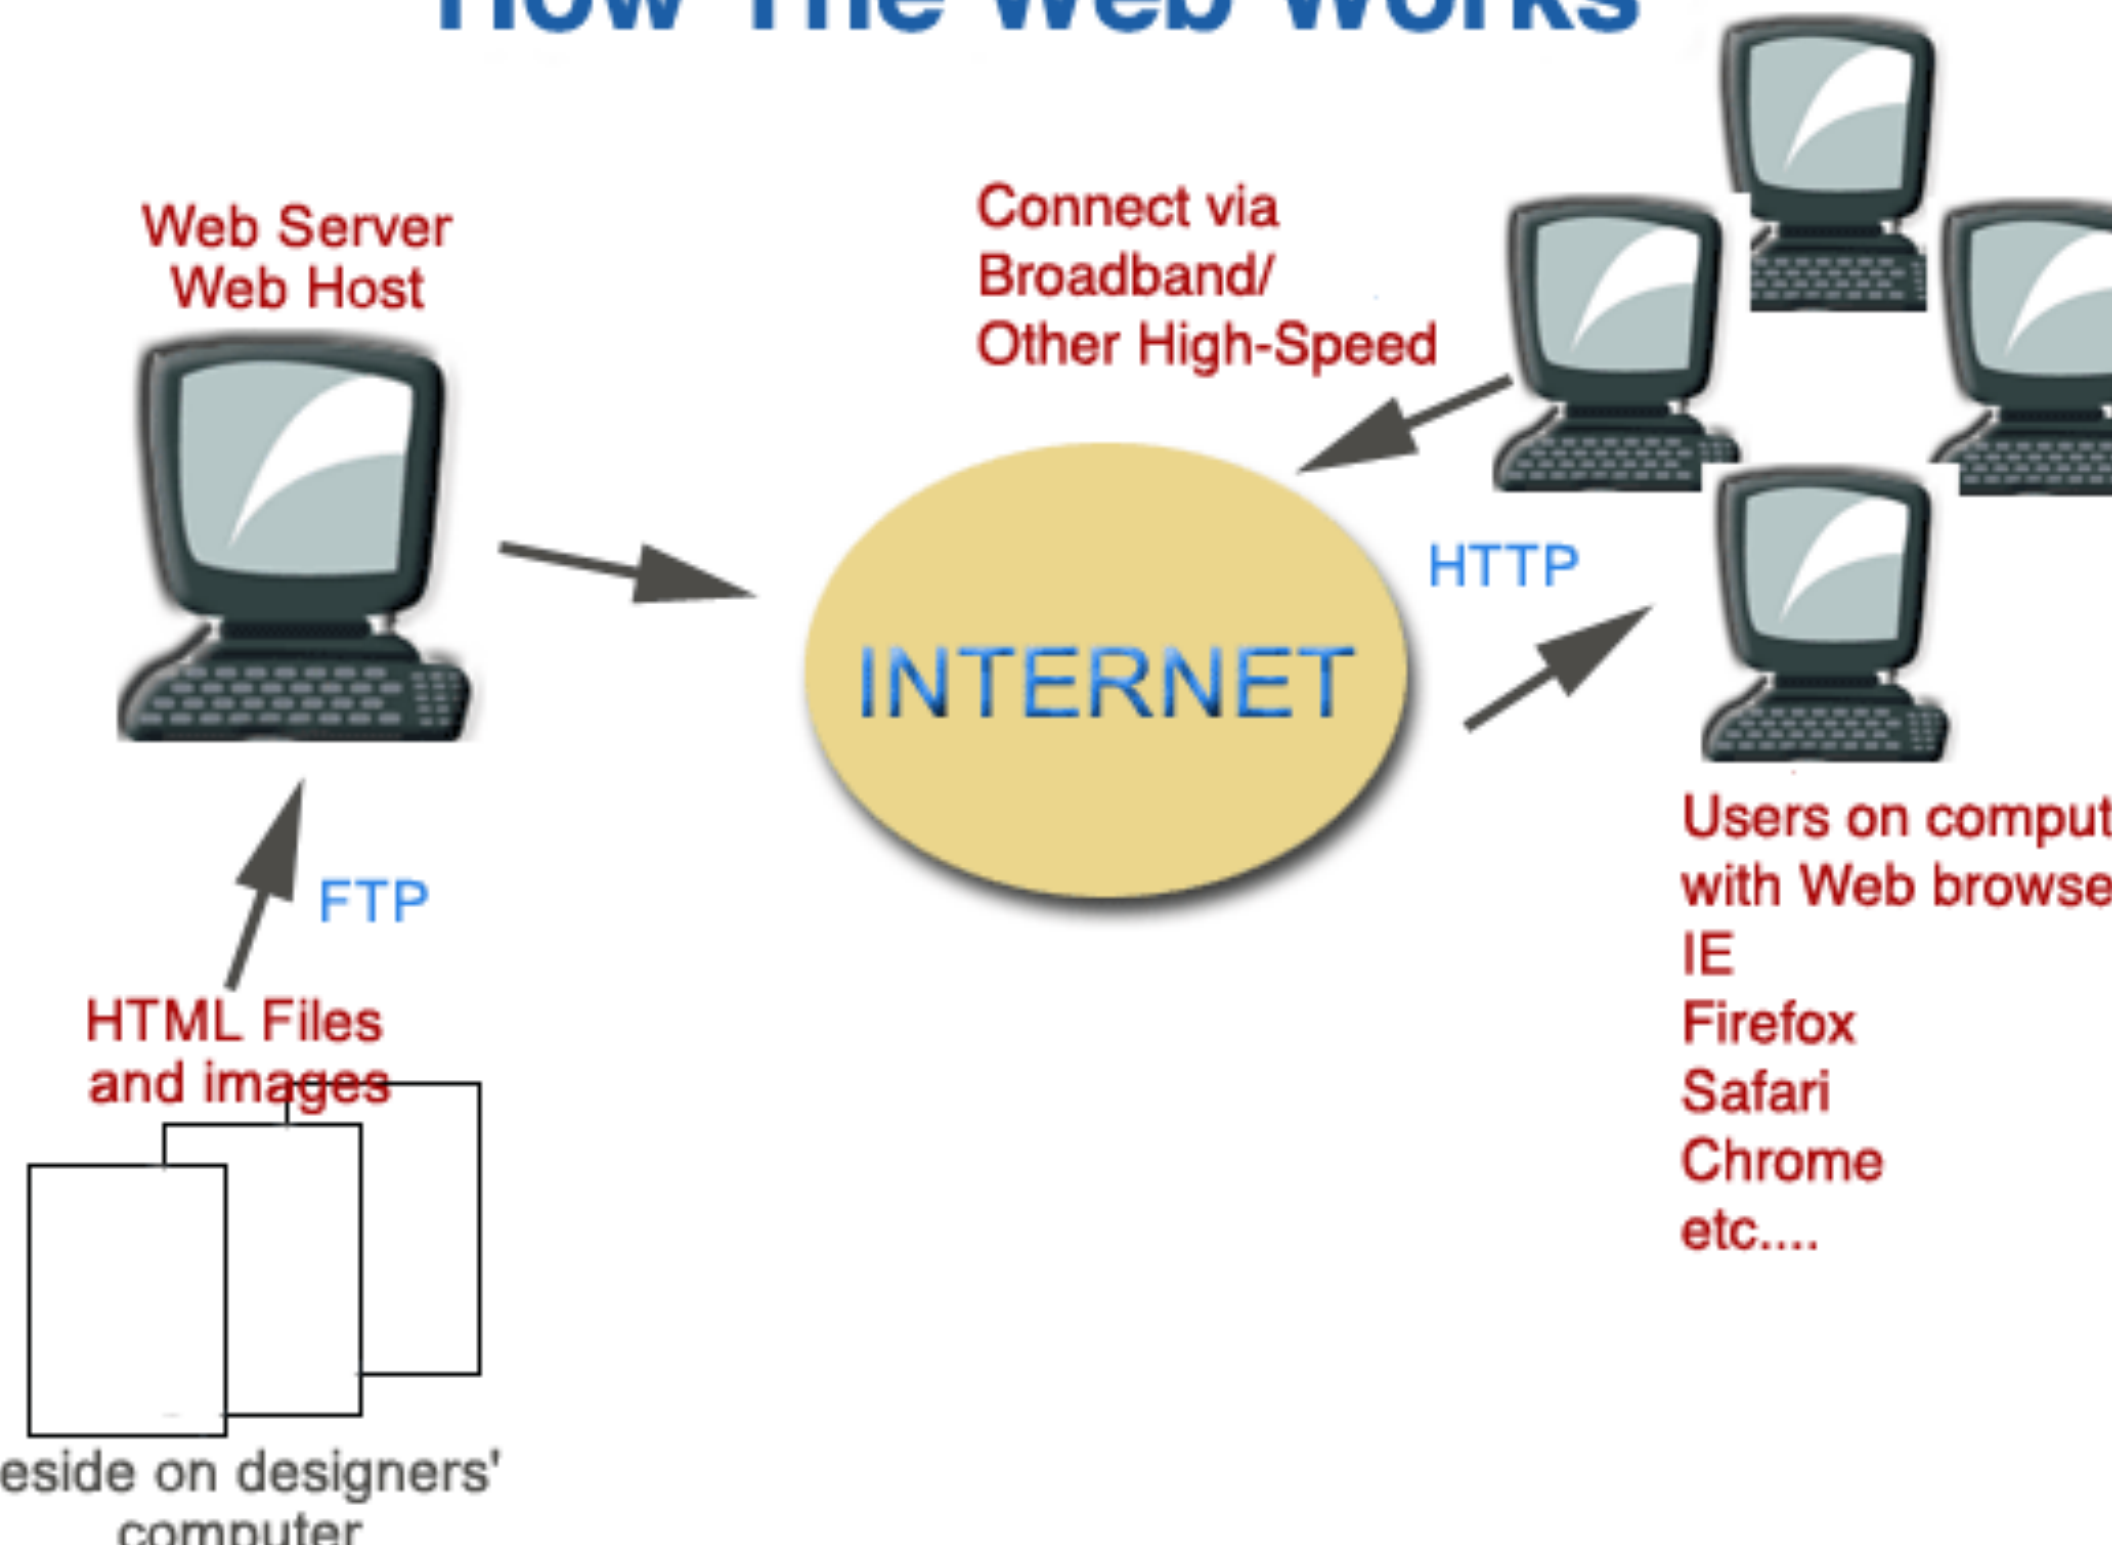

– 15 min. break at 8pm

Short (5-10 min) quizzes on Thursdays

Homework – short assignment for each class

– Recommended activities/resources

How The Web Works

Parts of a Website

HTML – content markup

CSS – layout/styling

JavaScript – client-side behavior

Ruby on Rails – server-side behavior

What is HTML?

Hyper Text Markup Language

Marks up text

With CSS, associates style information

HTML files contain tags and regular text

Creating an HTML File

Quick demonstration –what you see, what the browser sees

An HTML file can be created in any plain text editor – it is a plain text file that ends in .htm or .html.

HTML files are typically edited in applications like Sublime Text 2, TextWrangler, and BBEdit.

HTML tags

An tag is enclosed in 2 angle brackets (<>)

A closing tag has a / before the keyword

For instance, <html> is the opening tag,
</html> is the closing tag of the document

Other Tag Info

Tags, much of the time, have other tags inside of them

Beware of improper nesting:

b>

/li>

Elements

HTML Attributes

HTML elements can have **attributes**

Attributes provide additional
information about an element

Attributes are always specified in the start tag

Attributes come in name/value pairs

like: `name="value"`

More on links

Target attribute, to open the link in a new window

ID to specify an anchor.

```
a href="http://google.com" target="_r  
id="google">Google</a>
```

An anchor allows you to send people to a certain part of your page using another link

```
a href="#google">Visit our Link to  
Google</a>
```

More on anchors

Anchors can be used in any link to the page as well.

```
<a href="page.html#google">Visit the  
Link to Google on the Page!</a>
```

Anatomy of a Webpage

Doctype

- tells the browser what HTML version you're using. Always use:

`<!DOCTYPE html>`

HTML

- Head section - loaded first, user does not see it
- Body section - Page content

```
<!doctype html>  
<html>
```

head

```
<head>  
  <title>This text shows up in the menu bar</title>  
</head>
```

```
<body>  
  You can see this text.  
</body>  
</html>
```

body

HTML Tags

<!DOCTYPE html>

<html></html>

<head></head>

<title></title>

<body></body>

The <head> Section

The <head> section of your file contains more than just the title of your document

This section of your document is meant to enclose links to external files as well

You can also create CSS or JavaScript in this space that will work with your page

HTML Tags 2

<p></p>

<h1></h1>, <h2></h2>, etc.

<a>

Lists

Lists are declared with the `` tag, which denotes unordered list.

List items are declared with the `` tag.

```
<ul> <li>Item one </li><li>Item two</li></ul>
```

HTML Text Formatting

Although text should be styled with CSS in most cases, there are tags to format text within HTML itself

- `` makes text bold``
- `<i>` makes it italic`</i>`,
- `<u>` creates an underline`</u>`

Notes

NEVER forget the end tag!

Use tabs for easier to read code

Marking Up

Let's mark up a document with HTML!

Tables

Tables are an important layout element, but have mostly been replaced by `<div>` and `` tags for basic page layout

Only use tables for tabular data!

Tables

A table begins with a `<table>` tag

A row starts with the table row tag, `<tr>`

A column with the row starts with a `<td>`, or table data, tag

Sample Table

```
able>
```

```
tr>
```

```
<td>
```

Hello!

```
</td>
```

```
</tr>
```

```
able>
```

iFrames

An Iframe is another HTML page or website view in a frame inside your HTML page

This is how some websites create embeddable widgets

```
<iframe src="page.html"></iframe>
```

Embedding Javascript

To embed JavaScript in your page, use the script tag

```
<script type="text/javascript" src="yourfile.js"></script>
```

Create Your Own

Markup your own page.

Feel free to use Google to look things up.

– www.w3schools.com is a great resource!

<div> and

<div> represents a generic element (a "division") – you can style it however you want.
 is similar – used for inline text styling.

<div>

<p>This is a paragraph.</p>

<p>This is another paragraph.</p>

<div>
